ONE-SLIDE PRESENTATION

SEIR Model: There Are Multiple Infection Waves

Hypothesis: The SEIR model will show multiple infection waves over 1500 days because of the exposed stage and population replenishment.

Verdict: Supported — repeated, damped infection waves were observed.

SEIR 1500-day plot

KEY NUMBER
5 peaks (green line)
Over 1500 simulated days

MODELING LESSON

Declining infection waves do not necessarily mean disease elimination; infections may stabilize at a nonzero endemic equilibrium.
